OBJECTIVES

- **Develop a satellite-based icing detection methodology that can be applied operationally with results provided in a timely manner as part of an integrated icing product for the aviation community**
- **Use satellite data to provide near-real time cloud-top & base altitudes for aviation weather applications**

NASA Langley Research Center / Atmospheric Sciences

FAA In-flight Icing/Ground De-icing International Conference, Chicago, IL, June 16-20, 2003

OUTLINE

- **DESCRIPTION OF METHODOLOGY AND CLOUD PRODUCTS**

(Minnis)

- **RELATING AIRCRAFT ICING TO SATELLITE CLOUD PARAMETERS**

(Smith)

- **DEMONSTRATION OF PROTOTYPE PRODUCT**

(Minnis)

FAA In-flight Icing/Ground De-icing International Conference, Chicago, IL, June 16-20, 2003

APPROACH

- Use cloud properties currently being derived from satellite data at various time and space scales and relate them to aircraft icing

-Developed & applied algorithms to various satellite (GOES, AVHRR, etc.) data for field programs for climate research

- Currently deriving global cloud and radiation parameters from EOS sensors for global change studies as part of the Clouds and Earth's Radiant Energy System (CERES) Experiment **post processing**

- Applying similar algorithms to 4-km GOES data to derive cloud and radiation parameters for DOE ARM program over SGP, for NASA CRYSTAL(FL), Icing (Midwest) **running experimentally in R/T**

PIXEL-LEVEL CLOUD PROPERTIES

EFFECTIVE RADIATING TEMP	T_c
EFFECTIVE HEIGHT, PRESSURE	Z_c, p_c
TOP PRESSURE, HEIGHT	p_t, z_t
THICKNESS	h
EMISSIVITY	ϵ
PHASE (water or ice; 1 or 2)	P
WATER DROPLET EFFECTIVE RADIUS	r_e
OPTICAL DEPTH	τ
LIQUID WATER PATH	LWP
ICE EFFECTIVE DIAMETER	D_e
ICE WATER PATH	IWP

Blue indicates utility for icing

NASA Langley Research Center / Atmospheric Sciences

FAA In-flight Icing/Ground De-icing International Conference, Chicago, IL, June 16-20, 2003

ICING

ICING CONDITIONS ARE DETERMINED BY CLOUD

- liquid water content, LWC **positive w/ intensity**
- temperature, $T(z)$ **negative w/ intensity**
- droplet size distribution, $N(r)$ **r positive w/ intensity**

SATELLITE REMOTE SENSING CAN DETERMINE CLOUD

- optical depth, τ
- effective droplet size, r_e
- liquid water path, LWP
- cloud top temperature, T_c
- thickness, h

IN CERTAIN CIRCUMSTANCES

NASA Langley Research Center / Atmospheric Sciences

FAA In-flight Icing/Ground De-icing International Conference, Chicago, IL, June 16-20, 2003

CLOUD PRODUCTS VS. ICING PARAMETERS

- $LWP = LWC * h$
- $re = f[N(r)]$
- T_c & h can yield depth of freezing layer
- z_t is top of icing layer
- $ceiling = z_t - h$

IN MANY CASES, SATELLITE REMOTE SENSING
SHOULD PROVIDE ICING INFORMATION

NASA Langley Research Center / Atmospheric Sciences

DATA

- GOES-8 IMAGER (4KM RESOLUTION) 75° W

Visible	(0.63 μm ; ch.1)
Solar Infrared	(3.9 μm ; ch.2)
IR Window	(10.8 μm ; ch.4)
Split Window	(12.0 μm ; ch.5) (G-12: 13.3 μm)

Visible Channel Calibrated Following Minnis et al. 2002

- Rapid Update Cycle (RUC) 20 km x 20 km hourly analyses

- *surface air temperature => skin temperature*
- *temperature & moisture profiles => absorption correction, heights*

- CERES clear-sky albedo, surface emissivity (10', 1°)

clear-sky reflectance, brightness temperature => cloud detection/retrieval

- Theoretical cloud reflectance & emittance models

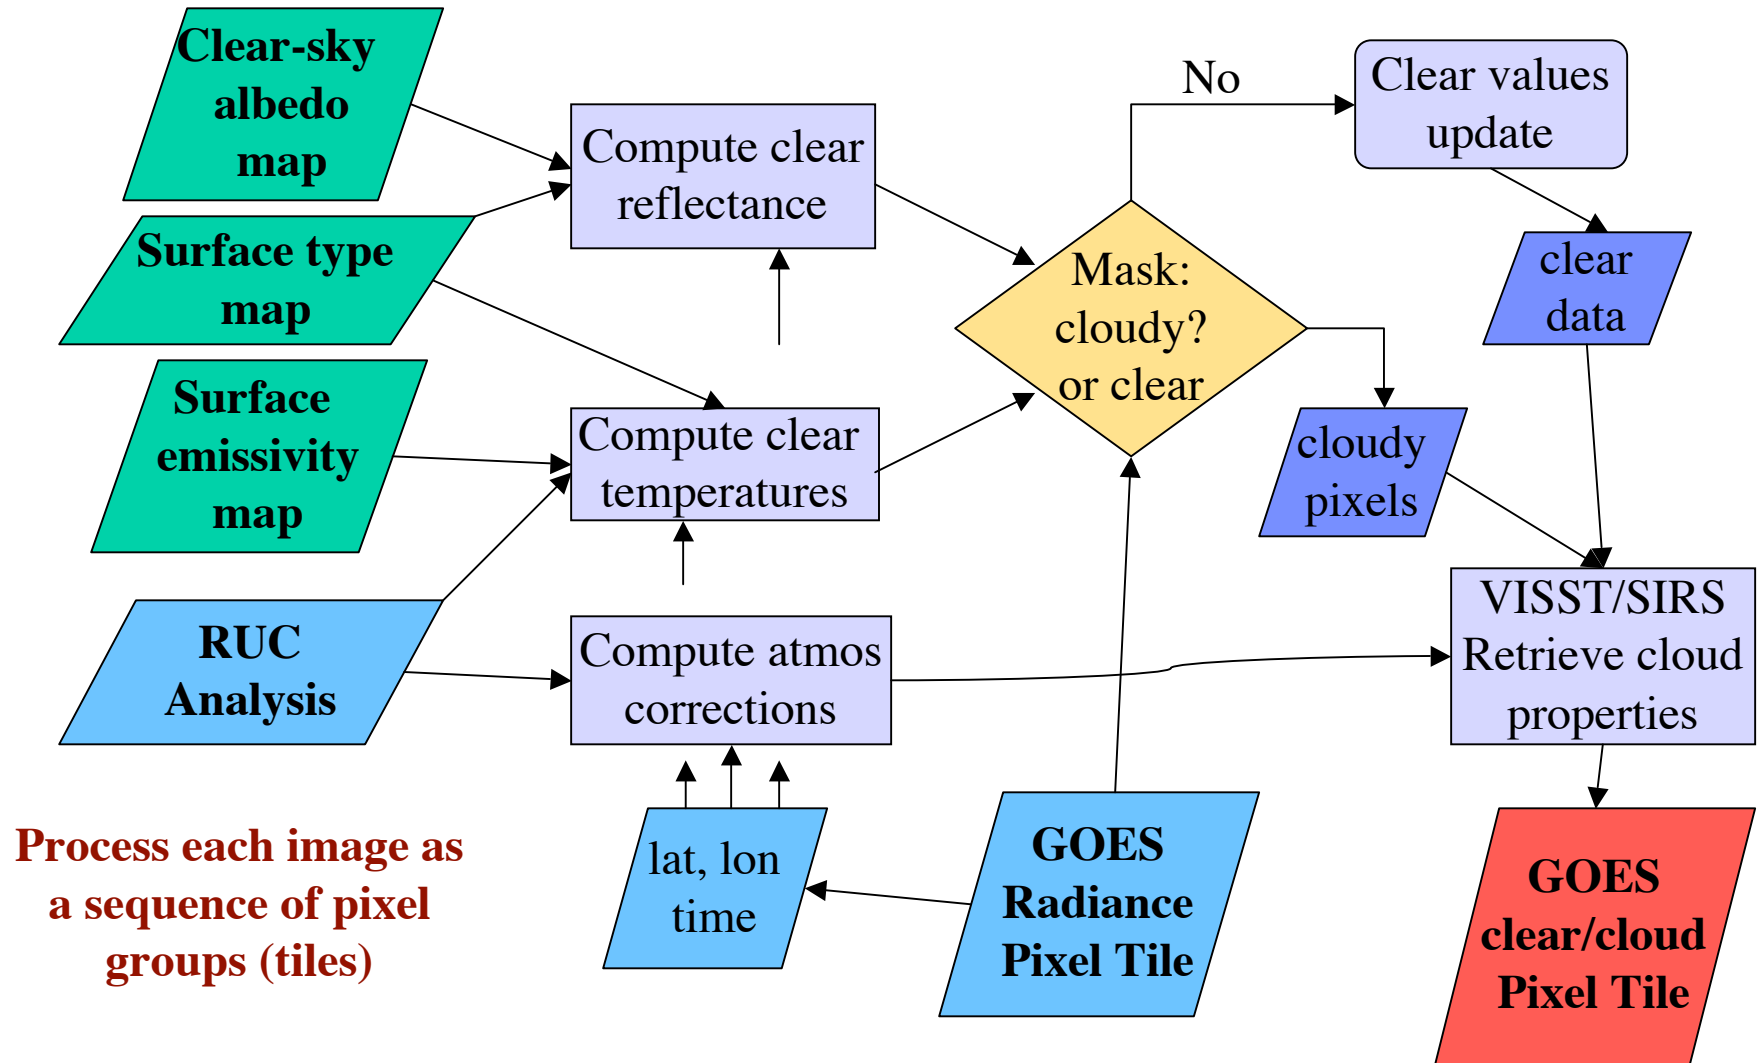

describes angular variation for range of θ and ϕ => cloud detection/retrieval

FAA In-flight Icing/Ground De-icing International Conference, Chicago, IL, June 16-20, 2003

METHODOLOGY FOR EACH IMAGE TIME

NASA Langley Research Center / Atmospheric Sciences

FAA In-flight Icing/Ground De-icing International Conference, Chicago, IL, June 16-20, 2003

CLOUD MASK

- To detect clouds, the radiances for cloud-free (clear) scene must be known
- Determine clear-sky albedos and surface emissivities after initial processing of data
 - start with CERES values and update
- Use RUC surface temperatures & profiles to estimate clear-sky brightness temperatures
- Must account for angular dependence: bidirectional reflectance models to estimate clear-sky reflectance for each pixel
- Estimate thresholds based on uncertainties in models & spatial/temporal variability of the clear radiances

NASA Langley Research Center / Atmospheric Sciences

FAA In-flight Icing/Ground De-icing International Conference, Chicago, IL, June 16-20, 2003

CLEAR-SKY RADIANCE CHARACTERIZATION

- Predict radiance a given satellite sensor would measure for each channel if no clouds are present
- Estimate uncertainty based on spatial & temporal variability & angular model errors
- Develop set of spectral thresholds for each channel
 - Solar, uses reflectance, ρ
 - IR, use temperature, T

brightness temperature difference, $BTD = T_{\lambda 1} - T_{\lambda 2}$

typically, $BTD(3.7-11)$ or $BTD(11-12)$

NASA Langley Research Center / Atmospheric Sciences

FAA In-flight Icing/Ground De-icing International Conference, Chicago, IL, June 16-20, 2003

CLEAR-SKY REFLECTANCE, SOLAR

- Estimate overhead-sun albedo, $\alpha_o = \alpha(\mu_o = 1)$

derived empirically with initial runs using CERES VIRS data, then updated for each month using GOES

- Estimate albedo at given local time, $\alpha(\mu_o) = \alpha_o \alpha_o(\mu_o)$

directional reflectance model $\alpha_o(\mu_o)$ derived for each IGBP type using VIRS

- Estimate reflectance for given viewing angles, $\alpha(\mu_o, \mu, \phi) = \alpha(\mu_o) \alpha(\mu_o, \mu, \phi)$

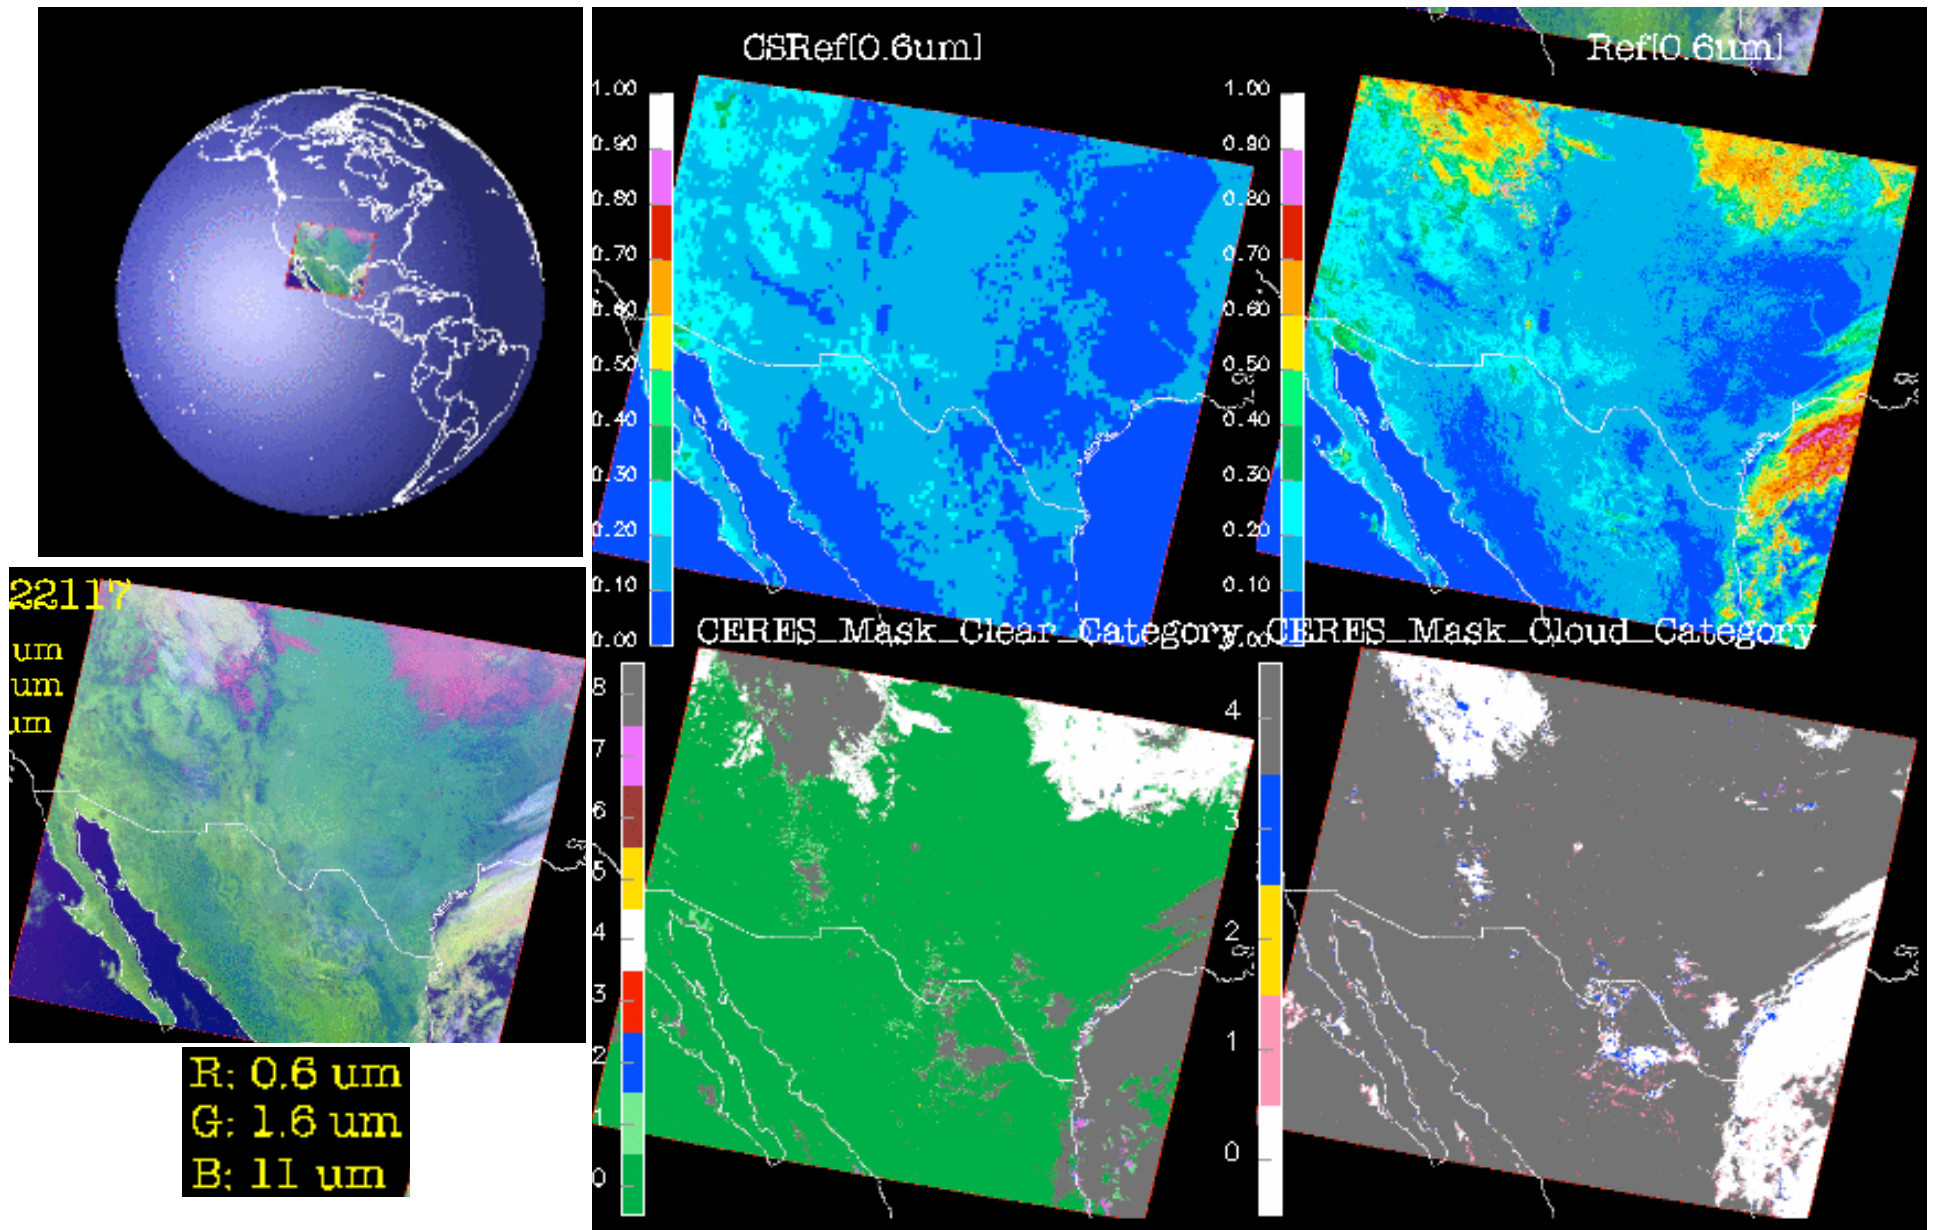

bidirectional reflectance (BRDF) model α selected for each surface type

from Kriebel (1978), Minnis & Harrison (1984), Suttles et al. (1988)

- Add uncertainty to set reflectance threshold, $\alpha_T(\mu_o, \mu, \phi) = \alpha + \Delta\alpha(\mu_o, \mu, \phi)$

PREDICTED CLEAR-SKY & OBSERVED VIS REFLECTANCE & CLOUD MASK 1700 UTC, 12/21/00

CLEAR-SKY TEMPERATURE, INFRARED

- Estimate surface emissivity, $\epsilon_s(x,y)$

*derived empirically with using ISCCP AVHRR DX, VIRS, then Terra MODIS;
water & snow theoretical models*

- Estimate radiance leaving the surface, $L_s = \epsilon_s B(T_{skin}) + (1 - \epsilon_s) L_{ad}$

L_{ad} = downwelling atmo radiation, T_{skin} = skin temperature from model / obs

- Estimate TOA brightness temperature, $B(T_{cs}) = (1 - \epsilon_a) L_s + \epsilon_a L_{au}$

L_{au} = upwelling atmo radiation, ϵ_a = effective emissivity of atmo

layer absorption emission computed using T/RH profile, correlated k-dist

- Add uncertainty to set T or BTD thresholds, $T_T(\mu) = T_{cs}(\mu) + \Delta T(\mu)$

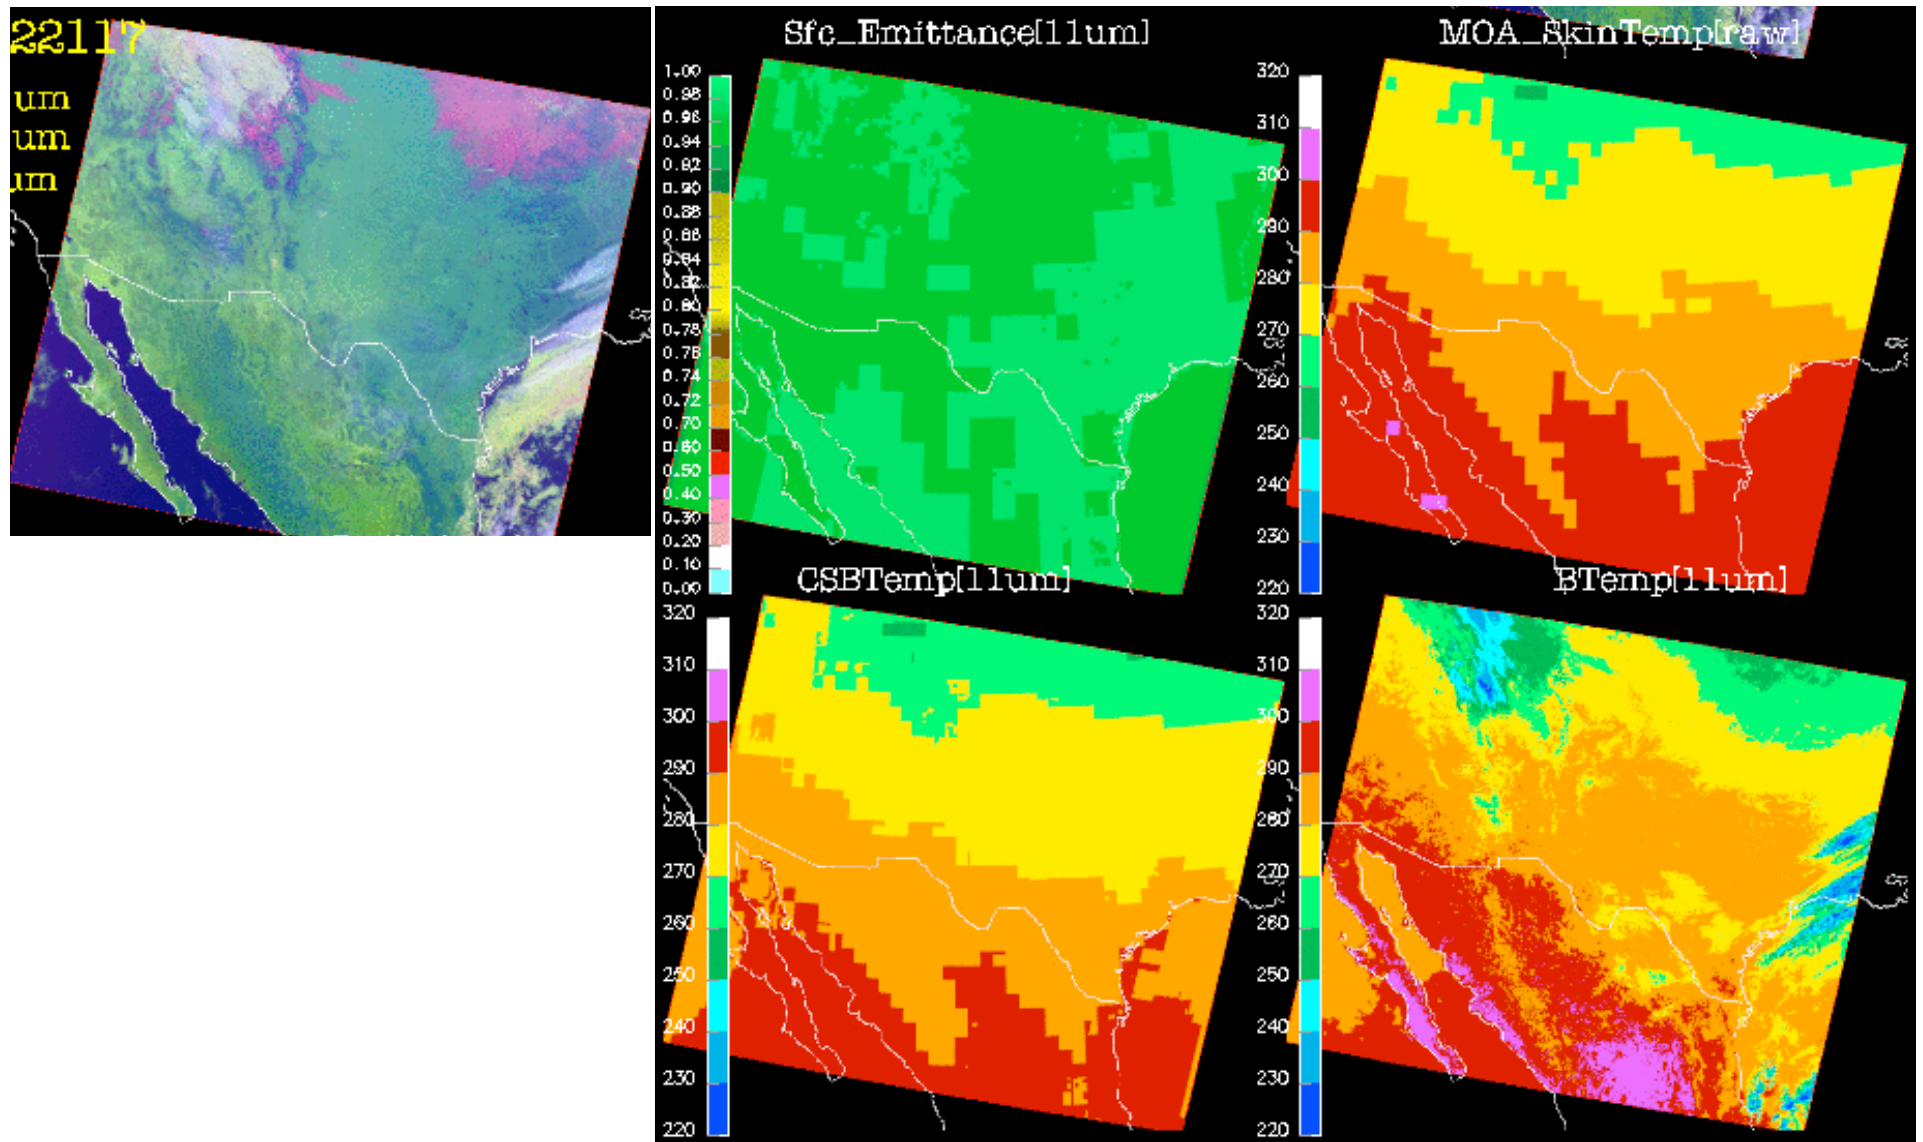

- reflected solar component included in 3.7-4.0 μm estimate

DAYTIME CLOUD RETRIEVALS

- **VISST (Visible, infrared, solar-infrared, split-window technique)**
 - physically based method using 0.65, 3.7, 11, & 12 μm
 - for cloudy pixels, match radiances to model values
- **Yields more accurate cloud temperatures than simpler methods**
 - adjusts temperature (altitude) of thin clouds
- **Provides basis for determining phase**
 - in most cases, ice & water models are distinct

NASA Langley Research Center / Atmospheric Sciences

FAA In-flight Icing/Ground De-icing International Conference, Chicago, IL, June 16-20, 2003

Daytime Cloud Property Retrievals

- Derive cloud properties by matching observed radiances to model calculations for water droplets ($2 < r_e < 32 \mu\text{m}$) and ice crystals ($6 < D_e < 135 \mu\text{m}$) through reflectance and emittance parameterizations
- $3.9 \mu\text{m}$ (GOES Channel 2) used for particle size retrieval
- Particle phase determined by:
 - (1) Best available model solution
 - (2) $T_{10.8} - T_{12.0}$ Difference
 - (3) Visible/IR Layer Retrieval
 - (4) Retrieved Cloud Temperature

Cloud Tau, phase, r_e (D_e), LWP (IWP), Z_{cld} , T_{cld}
